DIY: Significant Digits

To review the Significant Digits, watch the following YouTube video. The video goes over what are significant digits and performing arithmetic operations on them. They are followed by several practice problems for you to try, covering all the basic concepts covered in the video, with answers and detailed solutions. Some additional resources are included for more practice at the end.

- Significant digit basics and arithmetic with significant digits
  https://www.youtube.com/watch?v=6oj4y0d44nQ
- More on adding/subtracting with significant digits
  https://www.youtube.com/watch?v=xHgPtFUbAeU
- More on significance of zeros
  https://www.youtube.com/watch?v=7b60RZqut0U
- Why significant digits are important
  https://www.youtube.com/watch?v=VAuslY-Uuf4
- Exact numbers vs. measured numbers:
  https://www.youtube.com/watch?v=WT_6g3NCClE

Practice problems: The following problems use the techniques demonstrated in the above video. The answers are given after the problems. Then detailed solutions, if you need them, are provided after the answer section. For further assistance and help please contact Math Assistance Area.

1. Write the number of significant digits for the following
   a) 26.36  
   b) 5601.203  
   c) 69,000  
   d) 9000.10  
   e) 45.36 \times 10^{-5}  
   f) 1.08 \times 10^{10}  
   g) 9.8560 \times 10^{-8}  
   h) 2.0 \times 10^{23}

2. Perform the indicated operation and write your answer in appropriate significant digits.
   a) 0.2364 + 1.020  
   b) 1.6502 - 5.36  
   c) 2501.30 ÷ 605.00  
   d) 45.0 + 30.0  
   e) 36.20 \times 1.23  
   f) 800 - 52  
   g) 0.58 \times 2  
   h) 3.69 ÷ 10

3. a) What is the area of a circle with radius 30.205 m? Write the answer in appropriate significant digits. (Hint: \( A = \pi r^2 \))  
   b) If this circle is to be constructed using material that costs $49.75 per square meter, what is the cost of the circle? (Assume the material cost is rounded to the nearest cent).

4. A projectile shot in air from the ground at initial velocity of 109.30 ft/s. Find the height of the projectile in 5 seconds, if it follows the following path
   \[ h(t) = -16t^2 + v_0t \]
   where \( v_0 \) is the initial velocity of the projectile

Answers:

1. 
   a) 4  
   b) 7  
   c) 2*  
   d) 6  
   e) 4  
   f) 3  
   g) 5  
   h) 2

2. 
   a) 1.256  
   b) -3.71  
   c) 4.1344  
   d) 75.0  
   e) 44.5  
   f) 700  
   g) 1.2 or 1  
   h) 0.4 or 0.369*

3. a) 2866.2 m²  
   b) $142,600

4. 150 or 146.50 feet*

* see detailed solutions for explanation
Detailed Solutions

1. a. 26.34 has 4 significant digits.

b. 5001, 203 has 7 significant digits (5,1). All non-zero digits are significant, and zeros that occur between non-zero digits are significant also.

c. 69,000. According to the guidelines from the video, this would have 2 significant digits. The zeros to the right of the last non-zero digit (6) would not be considered significant in the absence of a decimal point. However, it is ambiguous in this form since the original measurement could have been 69,000, so 69,000 would be correct to the tens digit.

d. 9,000.10 has 6 significant digits – 2 non-zero digits, 3 "sandwiched" zeros, and a trailing zero to the right of the decimal point.

e. 45.67 \times 10^5 has 4 significant digits. If this number were written without the power of 10 it would be 45,6700. In this form, the 4 zeros to the right of the decimal point are not significant since they are not to the right of all non-zero digits. These 4 zeros are needed for place values only.

Note: Leading zeros (to the left of all non-zero digits) are never significant, so 000004536 could be written as 4536, still with only 4 significant digits. The leading zero in the left of the decimal point is often included to draw attention to the decimal point.

f. 1.08 \times 10^6 has 3 significant digits. Note that the " \times 10^6" adds no significant digits. This purpose is to establish place values. Written without the power of 10, this number would be 10,800,000, with no decimal point shown. Ending zeros (with no non-zero digits or decimal point to the right) are not significant.
1. \(2.3560 \times 10^{-8}\) has 5 significant digits. The terminating zero to the right of the decimal is significant.

2. \(2.0 \times 10^{-3}\) has 2 significant digits.

2. a. \(0.2364 + 1.020 = 0.2364 + 1.020\)

\[
\frac{1.020}{1.2564} \rightarrow \frac{1.256}{1.256} \quad \text{The sum/difference of numbers can have no more decimal places than the least number of decimal places in the numbers being added/subtracted.}
\]

b. \(1.6502 - 5.36 = 1.6502 - 5.36\) or \(-\frac{5.36}{1.6502}\)

\[
\begin{align*}
1.6502 & - 5.36 \\
\approx & -3.7098 \\
\approx & -3.71
\end{align*}
\]

Answer can only have 2 decimal places since that is the least number of decimal places in the input numbers.

C. \(250.30 + 505.00 = \frac{4.13438017}{5} \approx 4.1344\)

\(\text{s.d.} = \text{significant digits}\)

\(\text{s.d.} = \text{significant digits}\)

D. \(45.0 + 30.0 = 75.0\) since both numbers being added are precise to the nearest tenth, the answer will be given to the tenths.

But note: If the problem were \(45.0 + 30\), the answer would be 80, 30 is only precise to the tens, so 75.0 would be rounded to the nearest ten: \(75.0 \rightarrow 80\).
2. \[ \frac{36.20 \times 1.23}{4 \text{ s.d.}} = \frac{0.58}{1.16} \]
   - answer should have 3 significant digits.
   - first non-significant digit is less than 5, so don't round up.

3. \[ 800 - 52 = 748 \approx 700 \]
   - 800 is precise only in the hundreds.
   - 52 is precise in the ones (units).
   - Therefore, our answer can only be precise to the hundreds.

4. \[ 0.58 \times 2 = 1.16 \]
   - In this case, without any further context to the problem, it is ambiguous as to whether the "2" is a measured quantity (with only 1 significant digit) or an exact number (meaning we are doubling the 0.58. For example, an item costs $.58 and one buys 2 items.)

   - In this case, an argument could be made for an answer with 1 significant digit (assuming 2 is a measured quantity), so the answer would be 1 or 1.
   - It may also be reasonable to interpret the "2" as an exact number (infinite number of significant digits), in which case we should interpret "0.58 \times 2" as "0.58 \times 0.58" = 0.3316 (2 decimal places).
     - (buying 2 items at $.58 each could cost $1.16).
   - However, the best answer may be 1.2
     - If 2 is exact, then 0.58 has 2 significant digits and the product would have 2 s.d. \( \approx 1.16 \) or 1.2.
     - To show the sense of this: 0.58 could be 0.575 to 0.585 in which case 2(0.58) could be any number 1.15 to 1.17, so expressing the answer as 1.2 would be the best answer.

   - Notes: in the "real world" this problem would have more information about the context, so it would be clearer which approach is best.
2.6 \[ 3.69 \div 10 = 0.369 \]

Again, if 10 is interpreted as an exact number, then the answer should have 3 s.d.
\[ \text{Ans.} = 0.369 \text{ or } 0.369 \]

If 10 is interpreted as a measured quantity, then it could have only 1 s.d. and the answer should also only have 1 s.d. \[ \text{Ans.} = 0.4 \text{ or } 0.4 \]

3. a. \[ A = \pi r^2 = \pi (30.205)^2 = 2,866.2070033 \ldots \]

As long as we used \[ \pi \text{ } \text{key is best} \]
\[ \pi \text{ is an exact, but irrational number, so if we used 3.14} \]
\[ \text{for } \pi \text{, our answer would only have 3 significant digits.} \]

\[ A \approx 2866.2 \text{ } \text{m}^2 \]

b. \[ \text{Cost} = \text{area} \times \text{cost/m}^2 = \pi (30.205)^2 (49.75) \]
\[ = 142,593.7784142 \ldots \]
\[ \approx 142,600 \]

Notes:
1. Since the cost was specified to have been rounded,
   the cost per meter has 2 s.d., and if the approximation
   used for \( \pi \) had at least 4 s.d., then the answer should
   have 4 s.d. \[ \text{Cost} \approx 142,600 \]

2. It would not be appropriate to calculate cost using
   the rounded area: \[ \text{Cost} = 2866.2 \times 49.75 \]

Although in this case the same 4 s.d. answer
would result, in many cases, rounding intermediate
results can cause significant error in a final
calculation!
4. \( h(t) = -16t^2 + V_0 t \) where \( t = 5 \) sec. and \( V_0 = 109.30 \) ft/sec.

In this problem, we need to identify which numbers are measured quantities and which can be assumed to be exact.

1. Assume \( t = 5 \) is exact. The question is to find the height 5 sec. after launch.
2. \( V_0 \) is measured, with 5 s.d.
3. "16" is actually \( \frac{1}{2} \) acceleration on earth's surface due to gravity and is measured correct to 2 s.d. in this problem.

To find the correct answer, we use multiplication rules to find the value of each term, to the correct number of s.d.

Then we use addition/subtraction rules to put the two terms together.

\[
h(5) = \frac{-16(5)^2 + 109.30(5)}{2 \text{ s.d.}} \quad \text{to 5 s.d.}
\]

\[
= -400 + 546.50 \text{ ft.}
\]

\[
= -4.0 \times 10^2 + 5.465 \times 10^2 \quad \text{using scientific notation to show that the first zero in 400 is actually significant but the second zero is not}
\]

\[
= 1.4650 \times 10^2 \quad \text{(need 2 s.d.)}
\]

or \( 150 \) feet

Note: If we did not know that "16" was not exact, then

\[
h(5) = -400 + 546.50 = 146.50 \text{ feet}
\]
